

Qualitative Usability Study

We set up the study for which we are going to test the paper prototype of our product. And we also installed and learnt the Adobe XD to demonstrate our prototype.

- We have 4 participants.
- Read the introductory script to each participant about the study.
- Ask each subject to read and sign consent form and give a copy of the form to the subject. Assign a random number to the subject to ensure the data is anonymized, and use this number on all study material.
- Test several scenarios and record observational and video/audio data during the scenario.
- Administer a post-questionnaire survey that present to participants after the study.

Deliverables

- Preliminary script read to subjects.
- Blank consent form that we ask your subjects to sign.
- Observational worksheets with record of user actions and observations.
- Links to videos of subjects performing the tasks.
- Post-study surveys administered to subjects.
- A 2-3 page writeup summarizing the experience running this study, including what went well and what we feel could use improvements for the next version of this study.
- We created a short video of your demonstration and uploaded it to YouTube.
