Storyboard and Paper Prototype

In this assignment, we created both a storyboard and paper prototype for your project.

Storyboard

A storyboard is a 'comic book' like sketch of user using product. In the previous assignment, we created a functionality and use case scenario. We picked one of the functionalities, and drew out the storyboards for the three scenarios highlighted.

Paper Prototype

We created a paper prototype based on the design for our project. We drew our storyboard on paper, took photos and embed the photo in the final deliverable.

The paper prototype is an artifact that demonstrates the key functionality of your system. This part of the system is not to be coded, but to be a physical copy of your interface.

We built a low-fidelty prototype for this assignment, that is, a paper prototype. A paper prototype is a mock-up of the key functionality you plan to provide in your system.

Deliverable

We delivered a pdf file containing:

- Storyboards for the three scenarios of the functionality.
- Screenshots of paper prototype.
- A video of paper prototype in action.
- A usability testing plan.

- A discussion and analysis of your prototype.
